# Palliative Performance Scale (PPSv2)

PPS Level	Ambulation	Activity Level & Evidence of Disease	Self -care	Intake	Conscious level
PPS 100%	Full	Normal activity & work No evidence of disease	Full	Normal	Full
PPS 90%	Full	Normal activity & work  Some evidence of disease	Full	Normal	Full
PPS 80%	Full	Normal activity & work <i>with</i> effort Some evidence of disease	Full	Normal or reduced	Full
PPS 70%	Reduced	Unable normal activity & work  Significant disease	Full	Normal or reduced	Full
PPS 60%	Reduced	Unable hobby/house work Significant disease	Occasional assistance	Normal or reduced	Full or confusion
PPS 50%	Mainly sit/lie	Unable to do any work  Extensive disease	Considerable assistance	Normal or reduced	Full or drowsy or confusion
PPS 40%	Mainly in bed	Unable to do most activity Extensive disease	Mainly assistance	Normal or reduced	Full or drowsy +/- confusion
PPS 30%	Totally bed bound	Unable to do any activity Extensive disease	Total care	Reduced	Full or drowsy +/- confusion
PPS 20%	Totally bed bound	Unable to do any activity Extensive disease	Total care	Minimal sips	Full or drowsy +/- confusion
PPS 10%	Totally bed bound	Unable to do any activity Extensive disease	Total care	Mouth care only	Drowsy or coma
PPS 0%	Dead	-	-	-	-

**Instructions:** PPS level is determined by reading left to right to find a 'best horizontal fit.' Begin at left column reading downwards until current ambulation is determined, then, read across to next and downwards until each column is determined. Thus, 'leftward' columns take precedence over 'rightward' columns. Also, see 'definitions of terms' below.

## **Definition of Terms for PPS**

As noted below, some of the terms have similar meanings with the differences being more readily apparent as one reads horizontally across each row to find an overall 'best fit' using all five columns.

- 1. Ambulation (Use item Self-Care to help decide the level)
  - Full no restrictions or assistance
  - Reduced ambulation degree to which the patient can walk and transfer with occasional assistance
  - Mainly sit/lie vs Mainly in bed the amount of time that the patient is able to sit up or needs to lie down
  - $\bullet$   $\,$  Totally bed bound unable to get out of bed or do self-care
- 2. Activity & Evidence of Disease (Use Ambulation to help decide the level.)
  - Activity Refers to normal activities linked to daily routines (ADL), house work and hobbies/leisure.
  - Job/work Refers to normal activities linked to both paid and unpaid work, including homemaking and volunteer activities.
  - Both include cases in which a patient continues the activity but may reduce either the time or effort involved.

## **Evidence of Disease**

- No evidence of disease Individual is normal and healthy with no physical or investigative evidence of disease.
- 'Some,' 'significant,' and 'extensive' disease Refers to physical or investigative evidence which shows disease progression, sometimes despite active treatments.
- Example 1: Breast cancer:

some = a local recurrence

significant = one or two metastases in the lung or bone extensive = multiple metastases (lung, bone, liver or brain),

hypercalcemia or other complication

Example 2: CHF:

some = regular use of diuretic &/or ACE inhibitors to control
significant = exacerbations of CHF, effusion or edema necessitating

increases or changes in drug management

**extensive** = 1 or more hospital admissions in past 12 months for

acute CHF & general decline with effusions, edema, SOB

#### 3. Self-Care

- Full Able to do all normal activities such as transfer out of bed, walk, wash, toilet and eat without assistance.
- Occasional assistance Requires minor assistance from several times a
  week to once every day, for the activities noted above.
- Considerable assistance Requires moderate assistance every day, for some of the activities noted above (getting to the bathroom, cutting up food, etc.)
- Mainly assistance Requires major assistance every day, for most of
  the activities noted above (getting up, washing face and shaving, etc.).
  Can usually eat with minimal or no help. This may fluctuate with level of
  fatigue.
- Total care Always requires assistance for all care. May or may not be able to chew and swallow food.

## 4. Intake

- Normal eats normal amounts of food for the individual as when healthy
- Normal or reduced highly variable for the individual; 'reduced' means intake is less than normal amounts when healthy
- Minimal to sips very small amounts, usually pureed or liquid, and well below normal intake.
- Mouth care only no oral intake

## 5. Conscious Level

- Full fully alert and orientated, with normal (for the patient) cognitive abilities (thinking, memory, etc.)
- Full or confusion level of consciousness is full or may be reduced. If reduced, confusion denotes delirium or dementia which may be mild, moderate or severe, with multiple possible etiologies.
- Full or drowsy +/- confusion level of consciousness is full or may be markedly reduced; sometimes included in the term stupor. Implies fatigue, drug side effects, delirium or closeness to death.
- Drowsy or coma +/- confusion no response to verbal or physical stimuli; some reflexes may or may not remain. The depth of coma may fluctuate throughout a 24 hour period. Usually indicates imminent death
